

Oil

Our main blending platform consists of 8 vessels ranging in capacity for 4,000 litres to 45,000 litres. These vessels blend both automotive and industrial oils and are dedicated to product families to eliminate cross contamination issues. Smaller vessels are available for low volume or specialty products.

Grease

PDM prides itself on its grease manufacturing facilities and product technology. Our equipment consists of a “contactor” or high temperature, high pressure reactor to produce lithium and lithium complex soaps plus 3 autoclave finishing kettles to complete the manufacturing process. Our foodgrade greases are manufactured in a completely separate and dedicated facility.
